

AMBER COMPOSITES EXTENDS PRODUCT PORTFOLIO WITH OUT-OF-AUTOCLAVE AND UNIDIRECTIONAL PREPREG

April 9, 2010

This week Amber Composites announced two important additions to their product portfolio. These additions are key milestones for Amber as they further build on their complete portfolio of high-end composite materials.

[Multipreg E520](#) Out-Of-Autoclave component prepreg has been in customer trials over the past few months and has proven to be exceptionally easy to use with excellent surface finish. Multipreg E520 lets designers laminate a variety of components quickly, more efficiently and with no size limitations, while achieving a high quality cosmetic surface finish.

To improve service and reduce lead times, Amber Composites has increased its unidirectional prepreg manufacturing capabilities with the addition of a dedicated UD manufacturing line. Amber's superior resin formulations are now available in a wide range of woven, multi-axial and unidirectional formats, with the response times and high level of technical service that Amber is dedicated to providing for all of its products. The new unidirectional systems are designed to complement Amber's range of woven systems, and are available in a wide range of fibers and resin systems.

About Amber Composites

Amber Composites is a leading manufacturer of composite materials for high performance, lightweight structures. Amber provides materials and technical expertise to a diverse set of industries, including motorsport, automotive, aerospace, communications, marine and wind energy. Amber Composites is ISO-9001 certified.
